TREND USE AND DEVELOPMENT

The Rest of World Cost Trends are a compilation by Appraisal Services of various country cost/price indexes.

These are indexes as published by private institutions and government statistical agencies, with acknowledgment to this effect, where appropriate.

Appraisal Services feels that these indexes serve as a reasonable guide to inflationary trends in building and equipment costs at locations throughout the world.

These indexes are for use with local currencies. For countries where little equipment is manufactured, such as Hong Kong and Singapore, and/or for locations with a high percentage of imported equipment, it is more accurate and preferable to consider the trend of the country from which the machinery is purchased.

For example: German equipment should be trended only with the appropriate German Cost Trend.

Consideration should also be given for the currency exchange rates between the country of manufacture and the country where the property is located and operating.

For example: If a Swiss company purchases German equipment in Euros and then adds it to their asset records in Euros, the use of the appropriate German index is all that is required.

If, however that Swiss Company purchases German equipment in Euros but adds the equipment to their asset records in Swiss Francs then a conversion from Swiss Francs to Euros must be made, as of the original date of purchase, then the appropriate German index is applied. After trending the Euro value must then be converted back to Swiss Francs as of the current date.

USE OF THE COST TREND DATA

Each Rest of World cost trend table contains three data columns,

1. The effective month and year, or quarter and year of the index,
2. the index number taken from public and governmental sources,
3. and a multiplier.

The multiplier is the factor that should be multiplied by the earlier building or equipment cost to adjust that cost to the most recent date in the table.

To adjust original costs from an earlier date to a date other than the most recent date a different multiplier must be calculated. To do so divide the index number of the later date by the index number of the earlier date. Then multiply the result by the earlier building or equipment cost.

For Example: Estimate the cost of a Danish building in December 2017 that was built in mid-2007 for 2,000,000 DKr:

Original 2007 cost in DKr x (December 17 index/2007 index) = December 2017 cost in DKr.
 $2,000,000 \text{ DKr} \times 1.174 (102.3/87.2) = 2,348,000 \text{ Dkr}$
An increase of 17.4%

For any questions, comments and/or technical support please contact Appraisal Services at (401) 275-3000 ext. 2041, or an E-mail to 'Appraisal.Services@fmglobal.com'.

ASIA

HONG KONG

Most, if not all heavy equipment is imported. The effect of inflation on equipment prices is more accurately reflected by consideration of the trend of the country from which the machinery is purchased, coupled with proper consideration for the trend of currency relationships between the importing and exporting nations.

ASIA

SINGAPORE

Relatively little heavy equipment is manufactured. The effect of inflation on equipment prices is most accurately reflected by consideration of the trend of the country from which the machinery is purchased, coupled with proper consideration for the trend of currency relationships between the importing and exporting nations.
